It is hard to judge by the signal voltage what ECU is telling fan module to do. But you can check how much the voltage changes during ignition off/on, engine running/AC on to maximum cooling. If you see the change- this means ECU is giving out commands and wiring is ok. So that leaves Fan module as the weak link.

The radiator needs a constant flow of air through its core to cool it adequately. When the car is moving, this happens anyway; but when it is stationary a fan is used to help the airflow. The fan may be driven by the engine, but unless the engine is working hard, it is not always needed while the car is moving, so the energy used in driving it wastes fuel.
